

Assignment 2

Assignment 2 should be handed in before the **7th** of April. It consists of two different approaches. The **code should be handed in**, along with a short text of at least 600 words explaining the approaches and their potential value in a musical setting. The value of the assignment is 30% of the final grade.

1. Implement a set of Live Coding Tools, including sounds (Ndefs), processors (Ndefs) and scheduling (Pdefs or Tdefs) that can be used in a Live Coding situation. There should be at least **two sound generators, two sound processors and two scheduling processes** that can be activated and changed through the code itself without stopping. You should be able to connect these in different ways during a session, and the setup should reflect ideas you consider important for a live setup. In addition to the prepared code, the exercise should include a short performance focused on live coding, lasting at least 5 minutes and no more than 10. For this, we have reserved the NML on Friday, 27 March 2026.

The written text here should reflect on the design of the process chosen and how it is found to be suitable for a live-coding situation.

2. Implement a suite of CDP sound processes that transform a given input sound in various ways. The transformations should follow a logical sequence that guides the evolution of a given input sound. There should be only one input sound that is altered to form various outputs that can be used as a base for a composition. Finally, create an etude lasting at least **three minutes** based solely on material obtained from the sound-processing procedures.

The written text here should reflect on the different transformations chosen, what they offered and how the material could be arranged together based on those characteristics.
