

Assignment 2

Assignment 2 should be handed in before the **1st** of April. It consists of two different approaches. The **code should be handed in** as well as a small text with **a minimum of 600 words** explaining the approaches and the value these could have in a musical setting. The value of the assignment is 30% of the final grade.

1. Implement a suite of CDP sound processes that transform a given input sound in various ways. The transformations should follow a certain logic that will guide the evolution of a given input sound. There should be only one input sound that is altered to form various outputs that can be used as a base for a composition. Finally, create an etude that lasts at least **three minutes** based only on material obtained from the sound processing procedures.

The written text here should reflect on the different transformations chosen, what they offered and how the material could be arranged together based on those characteristics.

2. Implement a set of Live Coding Tools, including sounds (Ndefs), processors (Ndefs) and patterns (Pdefs or similar) that can be used in a Live Coding situation. There should be at least **two sound generators, two sound processors and two patterns** that can be activated and changed through the code itself without stopping. You should be able to connect these in different ways during a session and the setup should reflect ideas you consider important for a live setup. In addition to the **SuperCollider** code, you can also choose to use **TidalCycles**. In addition to the prepared code, the exercise should include a short performance that is focused on live-coding and has a minimum duration of five minutes. It can be done live in class or a submitted recording.

The written text here should reflect on the design of the process chosen and how they are found to be suitable for a live-coding situation.
